English (ing'lish), *n.* 1. One of the Low German group of languages, and that spoken by the people of England and the descendants of natives of that country, as the Americans, Canadian and Australian colonists, &c. It is a direct development of Anglo-Saxon (which see), and hence many people object to the distinction made between *English* and *Anglo-Saxon*, holding that the language ought to be called English throughout all the periods of its history, as it was among the Anglo-Saxons themselves. Although a direct development of Anglo-Saxon, that development did not proceed regularly and gradually by the action of internal causes, but was influenced from without by the Norman Conquest, the immediate result of which was that the language of the Normans (Norman-French, the chief element of which was Latin) became the chief literary language of England, Anglo-Saxon taking a very subordinate place. When the latter reappears after the Conquest as a written language, we find that, instead of being highly inflected or synthetic, as it was before that event, it has become analytic, that is, prepositions and auxiliaries are now used instead of inflectional prefixes and terminations to express the various modifications of the idea contained in any word, and the relations of the words in a sentence to one another. The vocabulary, however, appears but slightly affected, the Norman words in it being so few as scarcely to be worth taking into account. About the middle of the thirteenth century, the period from which English proper is usually regarded as taking date, a considerable number of Norman words make their appearance among those of Anglo-Saxon origin, such words having been adopted by writers of the subject race who wished to make themselves intelligible to both peoples, the Normans by this time, as it would seem, having begun to make use of Anglo-Saxon. There appear to have been three chief dialects of English—the Northern, Midland, and Southern, the second of which gradually became the dominant and literary dialect of the country, and is thus the immediate parent of our present English. Regarded in its widest acceptance as embracing both Anglo-Saxon and English proper, English has been divided into five periods:—(1) English of the first period, from 450 (the period when the Teutonic invaders began to make settlements in the country) to 1100. In this stage the language was synthetic, not analytic. The *Beowulf* is the most noted example of the English of this period. (2) English of the second period, from 1100 to 1250, when the influence of the Conquest begins to be perceived to a slight extent in the vocabulary and in a general weakening of the terminations. Of this period Layamon's *Brut*, a metrical chronicle of legendary British history, compiled chiefly from the French by a Worcestershire monk named Layamon, who lived about 1200; and the *Ormulum*, a long paraphrase of Scripture with a commentary, prepared by a monk called Orm or Ormin about 1215, may be cited as examples. (3) The third period, from 1250 to 1350, when inanimate objects begin to have no longer gender but to be classed as neuter. The infinitive takes 'to' before it, and the present participle ends in 'ing.' The metrical chronicles of Robert of Gloucester and Robert De Brunne are examples of this period. (4) The fourth period, from 1350 to 1400, when the Midland dialect has become the prevailing one. This period embraces the names of Chaucer and Gower. (5) The fifth period, from 1400 to the present time. This period has been subdivided into two—from 1400 to 1520, characterized by the diffusion of classical literature and the introduction of the printing-press, and from 1520 to the present time, in the course of which the language was to a great extent stereo-

typed by the works of Shakspeare and Milton, the publication of the Prayer-book, and above all, by the translation of the Bible. The language is now highly analytical, being the least inflectional of any of the Indo-European tongues. Although the English language is Teutonic as regards its grammar and particles, as well as the great proportion of words in daily use, yet perhaps no language has incorporated so many foreign words. The chief sources from which these contributions have been received are Norman-French, French and the other Romance languages, Latin, and Greek, besides contributions of greater or less extent from Celtic, German, Dutch, Hebrew, Persian, Hindu, Chinese, Turkish, Malay, American, &c. A great many of the terms borrowed from the last-mentioned languages are the names of articles forming objects of trade, names for which did not previously exist in English.—2. As a collective noun, the people of England.—3. In printing, a size of type between great primer and pica.

sense, engraving is the art of forming designs on the surface of metal plates or of blocks of wood for the purpose of taking off impressions or prints of these designs on paper. Wood-engraving appears to have come first into use, the earliest dated wood-engraving bearing date 1423, while the earliest dated engraving from a metal plate bears that of 1461. Wood-engraving differs from engraving in metal in that, while on a metal plate the lines or marks which are to appear on the paper are sunk into the plate, and before being printed from are filled with ink, the rest of the surface being kept clean, in wood-engraving they are left prominent, the blank parts being cut away, so that the wood-cut acts as a type, and is printed from in the usual way. The metals most commonly used for engraving are copper and steel. Different methods or styles of engraving on steel or copper are known as *aquatint*, *etching*, *mezzotint*, *stipple*, *line engraving*, &c. 2 That which is engraved; an engraved plate. 3 An impression taken from an engraved plate; a print.

Splendid and costly temples are dedicated to these animals; hospitals are built for their reception when sick or wounded; large fortunes are bequeathed for their support; and the laws of the land, which compound for the murder of a man by a trifling fine, affix the punishment of death to the slaughter of a monkey. Thus cherished and protected, the *entellus* abounds over almost every part of India, enters the houses and gardens of the natives, and plunders them of fruit and eatables at will. The visit is even considered an honour; and the Indian peasant would consider it an act of the greatest sacrilege to disturb or drive them away. *Quoted by Carpenter.*

simple stringed instrument that sounds by
the impulse of air. It generally consists
of a simple box of thin fibrous wood (often

stretched on low bridges at each end. Its
length is made to correspond with the size
of the window or aperture in which it is
intended to be placed. When the wind blows

thousand, nor for six hundred thousand, but for *eons*
embracing untold millions of years, this earth has
been the theatre of life and death. *Tyndall.*

zōon, animal.] The name given by Sir J. W.
Dawson, the geologist, to a supposed gigantic
fossil foraminifer, found in the Laurentian
rocks of Canada. If really an animal or
organism it is the oldest form of life trace-
able in the past history of the globe. See
extract.

The writer (Mr. T. Mallard Reade) asserts that
structures called *eozoönal* have not yet been dis-
covered in any unaltered rocks, while they are abun-
dant in metamorphosed rocks; and argues, from this
and other reasons, that Professors King and Rowley
are right in holding the *eozoön* to be a mere mineral
structure occasioned by the metamorphism of the
rock. Dr. Carpenter replies that the
eozoönal structure is most characteristically displayed
in those portions of the serpentine limestone of the
Laurentian formation which have undergone the
least metamorphic change, reiterating the arguments
derived from the structure itself, which have led him
and most other geologists to consider the *eozoön* as
of indubitable organic origin. *The Academy.*

to the *eozoön*. See extract under *Eozoön*.

lary, white, red, or purple
flowers, generally in leafy
spikes. Among those cul-
tivated in this country we

nearly an inch in length, of

at the base and pure white
at the apex.

The term is now, however, used to designate the whole mass of earth or other material which protects the guns in a battery both in front and on either flank; and it can only be distinguished from a parapet by being without a banquettes or step at the foot of the interior side on which the men stand to fire over a parapet. Equatorial (ē-kwā-tō'rī-al), *n.* An astronomical instrument, contrived for the purpose of directing a telescope upon any celestial object of which the right ascension and declination are known, and of keeping the object in view for any length of time, notwithstanding the diurnal motion. For these purposes a principal axis resting on firm supports is placed parallel to the axis of the earth's rotation, and consequently pointing to the poles of the heavens. On this polar axis there is placed, near one of its extremities, a graduated circle, the plane of which is perpendicular to the polar axis, and therefore parallel to the equator. This circle is called the *equatorial circle*, and measures by its arcs the hour angles, or differences of right ascension. The polar axis carries a second circle, called the *declination circle*, the plane of which is at right angles to that of the equatorial circle. This last circle has a telescope attached to it for making observations, and which moves along with it in the same plane. The name *equatorial*, or *equatorial instrument*, is sometimes given to any astronomical instrument

which has its principal axis of rotation parallel to the axis of the earth.

When two or more forces acting upon a body are so opposed to each other that the body remains at rest, although one of them would move it if acting alone, those forces are said to be in *equilibrium*, that is, equally balanced. See **STATICS**.—*Stable, unstable, and neutral or indifferent equilibrium*. When a body, being slightly moved out of any position in which it rests upon another body, always tends to return to its position, and, being left to itself, will roll back of its own accord into it, that position is said to be one of *stable equilibrium*; when the body will not thus return to its previous position, its position is said to be one of *unstable equilibrium*; and when a body, being moved more or less from its position of equilibrium, will rest in any of the positions in which it is placed, and is indifferent to any particular position, its equilibrium is said to be *neutral* or one of *indifference*. A body suspended by its centre of gravity is in a state of *neutral or indifferent equilibrium*. 3. A term about which, when applied to a scheme of jurisprudence, there is some confusion. Its three leading senses are distinguished thus:—(a) Taken broadly, equity means the doing unto all men as we would that they should do unto us. (b) In a narrower sense, equity is used in contradistinction to strict law; it expounds and limits the language of the positive laws, and construes them, not according to their strict letter, but rather in their reasonable and benignant spirit. (c) In the sense in which it is to be understood as the substantial justice expounded by the English courts of equity, it is the system of supplemental law administered in chancery, founded upon defined rules, recorded precedents, and established principles, the judges, however, liberally expounding and developing them to meet new exigencies. While it aims to assist the defects of the common law, by extending relief to those rights of property which the strict law does not recognize, and by giving more ample and distributive redress than the ordinary tribunals afford, equity by no means either controls, mitigates, or supersedes the common law, but rather guides itself by its analogies, and does not assume any power to subvert its doctrines. The Court of Chancery was formerly in England the special court of equity, but large powers were by the Judicature Act of 1873 given to all the divisions of the Supreme Court to administer equity, although many matters of equitable jurisdiction are still left to the chancery division in the first instance.

Equity is a roughish thing; for law, we have a measure, know what to trust to; *equity* is according to the conscience of him that is chancellor, and, as that is larger or narrower, so is *equity*. Selden.

2. In geol. contemporaneous in origin; corresponding in position in the scale of rocks; as, the equivalent strata of different countries. See *EQUIVALENT*, *n.* 3.—3. In geom. a term applied to surfaces or magnitudes which have equal areas or equal dimensions.

Equivalent (ē-kwiv'a-lent), *n.* 1. That which is equal in value, weight, dignity, or force with something else.

(Some men) fancy a regular obedience to one law will be a full equivalent for their breach of another. Rogers.

2. In chem. there is a law that if a body A unite with other bodies B, C, D, then the quantities B, C, D (the letters being used to denote the combining quantities as well as the bodies) which unite with it, or some simple multiples of these quantities, represent for the most part the proportions in which they unite among themselves. This law is called the law of equivalents, and the various quantities A, B, C, D (or a multiple of them) the equivalents of each other. Thus 1 part by weight of hydrogen unites with 8 parts by weight of oxygen to form water, with 35.5 of chlorine to form hydrochloric acid, with 16 of sulphur to form sulphuretted hydrogen; these quantities or their multiples are therefore regarded as equivalents of each other, 8 parts of oxygen uniting with 35.5 of chlorine to form chlorine monoxide, and 16 of sulphur with 8 x 2 of oxygen to form sulphurous oxide. When the atomic weights are taken into account (H=1, O=16, S=32, Cl=35.5) it is seen that one atom of hydrogen is equivalent to one of chlorine, and two atoms of hydrogen to one of oxygen and to one of sulphur; and taking the equivalency of hydrogen as unity, chlorine is what is called *monatomic*, oxygen and sulphur *diatomic*. Upon this equivalency or atomicity of the different elements is based their classification into *monads*, *dyads*, *triads*, *tetrads*, &c., and dashes are frequently appended to the symbols in a formula to show to which class the bodies belong, as H₂O¹, N²H₄, C³H₄, or C⁴H₄.—3. In geol. a stratum or series of strata in one district formed contemporaneously with a stratum or series of a different lithological character in a different region, or occupying the same relative position in the scale of rocks, and agreeing in the character of its fossils if deposited under similar circumstances. Thus the Caen building stone of France is the equivalent of our Bath oolite.

-Er, affix. 1. A termination of many English nouns, converting the word to which it is added into a noun of agency. It is the Teutonic form equivalent to the Latin *-or*, and native words may be roughly distinguished from words of Latin origin by this distinction; as, hearer, learner, doer, teacher, from auditor, instructor, factor, doctor. It was formerly a sign of the masculine gender—*stre*, *-ster* indicating the feminine; thus weaver, baker, malter, singer, brewer were masculine; webster, bakerster (*baxter*), maltster, songster, brewster, feminine. In *spinster* and *spinster* the distinction is still to some extent observed. Generally, however, the termination does not indicate gender in any way, some nouns in *-er* signifying a person or thing indifferently, as ruler, heater, grater, poker. Added to names of places it signifies an inhabitant of, or one that belongs to a place, as Londoner, Berliner, &c., a dweller in London, Berlin, &c.—2. That which makes evident or elucidates and enables the mind to see truth; proof arising from our own perceptions by the senses, or from the testimony of others, or from inductions of reason; as, our senses furnish *evidence* of the existence of matter, of solidity, of colour, of heat and cold, of figure, &c.; the declarations of a witness furnish *evidence* of facts to a court and jury; and reasoning, or the deductions of the mind from facts or arguments, furnish *evidence* of truth or falsehood. *Evidence* has been distinguished into *intuitive* and *deductive*. *Intuitive evidence* is of three kinds. (a) The evidence of axioms. (b) The evidence of consciousness, of perception, and of memory. (c) The evidence of those fundamental laws of human belief which form an essential part of our constitution; and of which our entire conviction is implied not only in all our speculative reasonings, but in all our conduct as active beings. *Deductive evidence* is of two kinds, *demonstrative* and *probable*; the former relating to necessary, the latter to contingent truths. Mathematical evidence is of the demonstrative kind. *Probable evidence* is founded on a belief that the course of nature will continue to be in time to come as it has been in time past. *Evidence* as to the authenticity or genuineness of a writing may be *internal* or *external*. *Internal evidence* is the evidence supplied by the composition and character of a work, as a poem or a painting; *external evidence* is the evidence brought in corroboration of the statements or genuineness of the work by neutral parties.

Internal evidence is generally deceptive; but the sort of *internal evidence* supposed to be afforded by comparative inferiority in artistic execution, is never free from great suspicion. Some of Plato's dialogues not being found equal to the exalted idea which his great works have led men to entertain, are forthwith declared to be spurious. But what writer is at all times equal to the highest of his own fancies? What author has produced nothing but *cheat-answers*? No one thinks of disputing Shakspeare's claim to the *Merry Wives of Windsor*, because it is immeasurably inferior to *Twelfth Night*, which, in its turn, is inferior to *Othello*.
G. H. Lewes.

—*Moral evidence*, evidence sufficient to satisfy the mind, although not susceptible of rigid and incontrovertible demonstration.

Mr. Gibbon remarks in his own life that, as soon as he understood the principles of mathematics, he relinquished his pursuit of them for ever; nor did he lament that he desisted before his mind was hardened by the habit of rigid demonstration, so destructive of the finer feelings of *moral evidence*, which must, however, determine the actions and opinions of our lives.
Edin. Rev.

2. The judges consisted originally of the lord treasurer, the chancellor of the exchequer, and three barons. By 5 and 6 Vict. v. the equitable jurisdiction of the court was abolished, and the chancellor of the exchequer, who belonged to the equity side of the court only, ceased to be one of the judges, these now consisting of a chief baron and four (afterwards five) puisne barons. It is common to say that inherited aptitudes are, after all, only a slower result of experience, developed in the race instead of the individual; and the like may be said still more evidently of the social tradition deposited in the growing language of mankind. The real bond, however, between experientialists at the present day and those of an earlier time, is that both declare experience to be the test or criterion of general knowledge, let its origin for the individual be what it may. Experientialism is, in short, a philosophical or logical theory, not a psychological one. *Prof. G. C. Robertson.*

What are called *explicatives* in rhetorical treatises are grammatically allied to the interjections, though widely differentiated from them by the want of meaning, which the interjection is never without. I can hardly agree with Webster in his definition of the *explicative*, and still less in the statement with which he concludes it. 'The *explicative*,' says Webster, 'is a word or syllable not necessary to the sense, but inserted to fill a vacancy or for ornament; the Greek language abounds with *explicatives*.' So far as the word answers no other purpose than 'to fill a vacancy,' it is properly *explicative*; but if it be appropriate and graceful enough to deserve the name of an 'ornament,' it is not superfluous, and therefore is not an *explicative*.
G. P. Marsh.

Thus, if $z = ax^2 + 2bxy + cy^2$, z is said to be an *explicit function* of x . If, on the other hand, z were connected with x and y by an equation of any other form, it would be called an *implicit function* of the latter. *Brande*.—An *explicit proposition* or *declaration* is that in which the words, in their common acceptance, express the true meaning of the person who utters them, and in which there is no ambiguity or disguise.

F.

F, the sixth letter of the English alphabet, is a labio-dental articulation, formed by the passage of breath between the lower lip and the upper front teeth. It is classed as a surd spirant, its corresponding sonant spirant being *v*, which is distinguished from *f* by being pronounced with voice instead of breath, as may be perceived by pronouncing *ef*, *ev*. (In *f*, of, however, it is *v*.) The figure of the letter *F* is the same as that of the ancient Greek digamma, which it also closely resembles in power. *F* is a common consonant in English words, both initially, medially, and finally, in the latter two cases being often doubled. As an initial it is very common in conjunction with *l* and *r*, as in *fly, free*. In plurals it often becomes *v*, as in *knife, knives, calf, calves*; compare also *life, live, strife, strive*, &c. Anglo-Saxon *f* has often been changed into *v* in modern English, as in *heaven, leave, carve*, &c., but such a change (as in *vices*) is rare initially. In *enough, rough, trough*, an *f*-sound now represents a former guttural. From several words *f* has dropped out, as from *head, hawk, lord, woman*. By Grimm's Law when words are common to English and Latin, Greek, Sanskrit, &c., wherever there is an *f* in English there is a *p* in these other tongues: thus *E. foot* = *L. pes, Gr. pous, Skr. pāda; E. father* = *L. pater, Gr. patrēr, Skr. pitr*.—As a Latin numeral it signifies 40, and with a dash over the top, *F* 40,000. *F* often stands for *Fellow*; *E.R.S. Fellow* of the Royal Society; *F.S.A. Fellow* of the Society of Antiquaries.—*F*, in *music*, is the fourth note of the diatonic scale.—In the calendar *F* is one of the seven Dominical letters.

The species most commonly used in falconry are the gyrfalcon or jervfalcon (*Falco gyrfalco*) and the peregrine falcon (*F. peregrinus*). The former is regarded as the boldest and most beautiful of its family, and next to the eagle the most formidable, active, and intrepid of birds. It is therefore held in the highest esteem for falconry, and was formerly imported from Iceland and Norway. The peregrine falcon being much more easily procured was much more commonly the object of the falconer's care. It builds on high rocks on the coast, and is more numerous in Scotland than England. The geographical distribution of the falcons is very wide, extending from the equator to the poles, and many species have been described. They are distinguished by a projection over the eyebrows, which gives their eyes the appearance of being deeply seated in their orbits. The beak is hooked and generally curved from its origin; there are three toes before and one behind, the claws are pointed and sharp, movable, retractile, and much hooked. The family includes the different species of eagles, the hawks and falcons properly so called, comprising the sub-families Polyborinæ (caracaras), Buteoninæ (buzzards), Aquilinæ (eagles), Falconinæ (falcons), Milvina (kites), Accipitrinæ (hawks), and Circinæ (harriers).

enter our atmosphere under the influence of the earth's attraction, and ignite and are vaporized in consequence of the friction resulting from the immense velocity with which they move. Rings or streams of these bodies are supposed to revolve round the sun, and to intersect the earth's orbit in two points, thus bringing great numbers of them within the sphere of the earth's attraction, and giving rise to the meteoric showers which occur at two periods of the year, about the 10th August and 13th November, the displays on the latter date being especially brilliant every 33 years. Fermentation (fêr'ment-a'shon), *n.* [L. *fermentatio*, from L. *fermento*, *fermentum*.] 1. The conversion of an organic substance into new compounds in presence of a ferment. Fermentation differs in kind according to the nature of the substance which promotes it. Sugar in solution is liable to two principal kinds of fermentation (*vinous* and *lactic*), both of which are probably due to the growth in the liquid of a mould or fungus. Fermentation may be checked or altogether prevented by anything which prevents the growth of the fungus, as by keeping away from the liquid the spores or germs from which the fungus springs, by the liquid being either too hot or too cold for its development, by its containing too much sugar, or by the presence of a substance (called an *antiseptic*) which acts as a poison on the fungus. *Vinous fermentation* is produced by the growth of the yeast-plant (see YEAST); *lactic fermentation* is due to the presence in the liquid of *Penicillium glaucum* (common blue mould). In vinous fermentation the sugar is converted into carbonic acid and alcohol, the nitrogenous element being assimilated by the rapidly developing ova of the ferment. Lactic fermentation takes place in milk in the process of becoming sour, when the sugar of the milk is converted into lactic acid. (See under LACTIC.) *Acetous fermentation* occurs in liquids which have already undergone vinous fermentation. When exposed to the atmosphere such liquids become sour, and vinegar is produced. This change is probably due to the growth of a fungus, *Mycoderma aceti* (the vinegar-plant). Other kinds of fermentation are *benzoic fermentation*, in which, amongst other matters, the essential oil of bitter almonds is formed; and *sinapic fermentation*, occurring in mustard moistened with water, during which oil of mustard is produced. For an explanation of fermentation, in relation to the origin and spread of contagious diseases, see GERM THEORY.—2. *Fig.* the state of being in high activity or commotion; agitation; excitement, as of the intellect or feelings, a society, &c.

It appears to be generated by the decomposition of partially carbonized coal, and when it constitutes more than 1/10th of the volume of the atmosphere of mines, the whole becomes highly explosive when fire is brought in contact with it. The safety-lamp affords the chief protection against the fatal effects of this gas.

common reservoir containing in its upper portion (the air-chamber) air compressed by the working of the engine. A tube dips into the water in the reservoir, and to the upper end of this tube is screwed the leather hose through which the water is discharged. The piston-rods are jointed to a double lever, the ends of which are connected with two long handles running parallel to the engine on each side, so that the lever may be worked by several men at once. The ends of the lever are thus raised and depressed alternately, and one piston ascends while the other descends, water being thus continually forced into the reservoir, except at the instant of the reversing stroke; and as the compressed air in the air-chamber performs the part of a reservoir of work the discharge of water from the hose is very steady. The engine is sometimes supplied with water by means of an attached cistern into which water is poured, but it is more usually furnished with a suction-pipe which renders it self-feeding. Fire-engines are now often worked by steam.

Except the lantern-fly, the fire-flies are all coleopterous, and are members of two nearly allied families, the Elateridae or skipjacks, and Lampyridae, to which the glow-worm belongs. Our British glow-worm has too little luminosity to entitle it to the name of firefly, but the *Lampyrus italica*, and *L. cornuta* of Canada are allied to it. True fireflies are found only in the warmer regions of the earth. The *Elater* or *Pyrophorus noctilucus* of South America and the West Indies is one of the most brilliant, giving out its light from two eye-like tubercles on the thorax. Wood is best protected by silicate of soda, which, on the application of strong heat, fuses into a glass, which enveloping not only the outside but also the internal fibres of the wood shield it from contact with the oxygen of the air. All that can be done by any process, however, is the prevention of conflagration; no mode yet known can prevent smouldering.

Thus in the Vedic hymns Agni is the god of fire, corresponding to the Greek Hephaestus. In the East the worship of the element of fire was practised by the ancient Persians or Magians, and is continued by the modern Parsees. The establishment of this species of idolatry among the Persians is ascribed to Zoroaster, who taught his disciples that in the sun and in the sacred fires of their temples God more especially dwelt, and that therefore divine homage was to be paid to these.

In the army a flag is a banner by which one regiment is distinguished from another. In the navy, flags borne on the masts of vessels not only designate the country to which they belong, but they are made to denote the quality of the officer by whom a ship is commanded. Thus in the British navy, an admiral's flag is displayed at the main-top-gallant-mast-head; a vice-admiral's at the fore-top-gallant-mast-head, and a rear-admiral's at the mizen-top-gallant-mast-head. In the navy the supreme

flag of Great Britain is the royal standard, which is only to be hoisted when the sovereign or one of the royal family is on board the vessel; the second flag is that of the anchor on a red ground, which characterizes the lord high-admiral, or lords-commissioners of the admiralty; and the third is the union flag, in which the crosses of St. George, St. Andrew, and St. Patrick are blended. This flag is appropriated to the admiral of the fleet. (See *ADMIRAL*.) In *mineral*, a sub-species of quartz, of a yellowish or bluish gray or grayish black colour. It is amorphous, interspersed in other stones, or in nodules or rounded lumps. Its surface is generally uneven, and covered with a rind or crust, either calcareous or argillaceous. It is very hard, strikes fire with steel, and is an ingredient in glass and in all fine pottery ware. The fracture of flint is perfectly conchoidal; though very hard it breaks easily in every direction, and affords very sharp-edged splintery fragments. Its true native place is the upper bed of the chalk formation, in which it is formed as a series of concretions, the silica in the shells of marine animals being attracted into nodules.

So stubborn *flints* their inward heat conceal,

Flint (flint), *a.* Made or composed of flint.—*Flint implements*, the name given by archaeologists to the implements used by man before the use of metals, so called because, although occasionally found of granite, jade, serpentine, jasper, basalt, and other hard stones, those first studied were mostly formed of flint. They consist of arrow-heads, axe-heads or celts, lance-heads, knives, wedges, &c. Flint implements have been found in the valley of the Somme and elsewhere, in apparently up-

heaved beds of 'drift,' and in connection with the remains of extinct species of the elephant, rhinoceros, and other mammals; and therefrom man's existence on the globe at a geological period anterior to the present has been inferred. Flint implements are still used by some savage tribes.

Flinters (flin'térz), *n. pl.* Flinders. [Vulgar.] **Flint-glass** (flint'glas), *n.* A species of glass, so called because pulverized flints were originally employed in its manufacture. It is extensively used for domestic purposes. Its dispersive power in regard to light renders it invaluable in the manufacture of the object-glasses of telescopes and microscopes, as by combining a concave lens of flint-glass with one or two convex lenses of crown-glass, which possesses a much less dispersive power, a compound lens is formed in which the prismatic colours arising from a simple refraction are destroyed, and the lens rendered achromatic. Quartz and fine sand are now substituted for flint in the manufacture of this glass.

Sometimes floating-docks are built in water-tight compartments, and ships to be repaired are easily floated into them, as they can be sunk to the required depth by the admission of water into the

compartments. When the vessel is docked, the floating-dock is raised by having the water pumped out till its bottom touches the keel of the ship. Props are then supplied to keep the ship in position, and the dock is raised still higher by the compartments being further emptied. Instead of compartments water-tight tanks may be used, and the dock raised and lowered on the same principle. Or again, floating-docks may be made so heavy as to sink by their own weight deep enough to allow the largest vessel to pass over their bottom. They are then raised by forcing down empty water-tight tanks, which lift dock and ship by their buoyancy. The cut represents the

Each cylinder has a manhole at the top for the reception of the substance to be stored in its interior. The W. *flur*, bloom, *fluraw*, to blow, to bloom, are probably borrowed from the English.] 1. In bot. the organs of reproduction in a phenogamous plant. A complete flower consists of stamens and pistils together with two sets of leaves which surround and protect them, the calyx and corolla. The stamens and pistils are the essential organs of the flower. They occupy two circles or rows, the one within the other, the stamens being in the outer row. The stamens consist of a stalk or filament supporting a roundish body, the anther, which is filled with a powdery substance called the pollen. The pistil consists of a closed cell or ovary at the base, containing ovules, and covered by a style which terminates in the stigma. These organs are surrounded by the corolla and calyx, which together are called the floral envelope, or when they both display rich colouring the perianth. The leaves of the corolla are called petals, and those of the calyx sepals. Some flowers want the floral envelope, and are called *achlamydeous*; others have the calyx but are without the corolla, and are called *monochlamydeous*. Flowers are generally *bisexual*, but some plants have *unisexual* flowers; that is, the pistils are in one flower and the stamens in another. Fluor-spar (flū-or-spar), *n.* (CaF.) A common mineral found in great beauty in Derbyshire; hence it is known in this country under the name of *Derbyshire Spar*. It generally occurs massive, but crystallizes in simple forms of the monometric system—viz. the cube, octahedron, dodecahedron, &c., and in combinations of the cube and octahedron. Pure fluor-spar contains 48.7 per cent. fluorine, 51.3 calcium. It is of frequent occurrence, especially in connection with metalliferous beds, as of silver, tin, lead, and cobalt ores, but is found in distinct veins in the neighbourhood of Freiberg and in the Harz. It is sometimes colourless and transparent, but more frequently it exhibits tints of yellow, green, blue, and red. From the general prevalence of a blue tint in the Derbyshire specimens it is there known as *Blue-john*. It is often beautifully banded, especially when in nodules, which are much prized for the manufacture of vases, and occasionally used for beads, brooch-stones, and other ornamental purposes. The term *fluor* is derived from the fusibility of this substance, on which account it is sometimes used as a flux to promote the fusion of certain refractory minerals. It is manufactured at Matlock and Derby into a great variety of articles, chiefly ornamental, and was held in high esteem by the ancients for the same purpose, being the material of the original myrrhine vessels. Its specific gravity is 3.14, but it is of very inferior hardness, being scratchable by quartz.

Fly (flī), n. [A Sax. *flēoge*, from *flēogan*, to fly; like G. *fliegen*, from *fliegen*.] 1. In zool. a winged insect of various species, whose distinguishing characteristics are that the wings are transparent and have no cases or covers. By these marks flies are distinguished from beetles, butterflies, grasshoppers, &c. The true flies or Diptera have only two wings, viz. the anterior pair. In common language, fly is the house-fly, of the genus *Musca*.

Being a 'popular name' the people have a right to mean what they choose by it, and they avail themselves of the right. Thus the fly of the farmer is usually the little hopping turnip-beetle; the fly of the hop-grower is an aphid; the fly of the herdsmen a gad; while to the citizen almost anything to be seen with wings is a fly. There are some, again, to whom flies are flies, one fly the fly, the common well-known little black house-fly. Here at least is something definite. No, not even now, for these will, at least, claim their young house-fly, and their full-grown house-fly, and expect you to believe that late in the year their house-fly takes to biting you, little dreaming that the little fly, and the big fly, and the fly which bites you, are not only different species but even belong to different genera; that the little fly never grows big, that the big fly never was little, and that their house-fly could not bite you if he would.

E. F. Staley.

Fly-wheel (flī'whēl), *n.* In *mach.* a wheel with a heavy rim placed on the revolving shaft of any machinery put in motion by an irregular or intermittent force, for the purpose of rendering the motion equable and regular by means of its momentum. This effect results from a law of nature that all bodies have a tendency to continue in their state either of motion or of rest until acted upon by some extraneous force. Thus

the rim of a fly-wheel, after a few revolutions, acquires a momentum sufficient to cause it to revolve with a velocity depending upon the resistance of the machinery and the augmentations and diminutions of the impelling power succeeding each other rapidly, while neither cause acts sufficiently long to either augment or diminish the velocity acquired in any considerable degree; and hence it remains equable, or nearly so. A fly-wheel is often used as an accumulator of force; thus, when a small steam-engine sets in motion a very large fly-wheel, the wheel acts as a reservoir of all the small pressures which have been communicated to it, and having thus concentrated them can apply them all together and at once when some great effect is to be produced.

Fogs are more frequent at those seasons of the year when there is a considerable difference of temperature in the different parts of the day. radial slits made to rotate in front of a fixed disk exactly similar, a cast-iron trumpet 20 feet long forming part of the apparatus. The moving disk revolves 2500 times a minute and in each revolution there are of course twelve coincidences between the two disks; through the openings thus made steam or air at a high pressure is made to pass, so that there are actually 33,600 puffs of steam or compressed air every minute. This causes a sound of very great power, which the trumpet collects and compresses, and the blast goes out as a sort of sound beam in the direction required. This fog-horn can be heard in all sorts of weather at from 2½ to 3 miles, and in an experiment made at Trinity House under favourable circumstances was heard 16½ miles out at sea.

In general, the font, in external form and character, followed the prevailing style of architecture and ornamentation. When not in use the font was covered. Originally, the covers were flat movable lids, but were afterwards often very highly ornamented, and sometimes carried up to a very considerable height in the form of spires, and enriched with a variety of little buttresses, pinnacles, and other decorations.

There are various styles of playing the game, but the two recognized in all important matches are the Rugby game and the Football Association game. In both games the main object is for either party to drive the ball (which is kicked off in the centre of the field) through the goal that their opponents are guarding, and thus count a goal against them. In the Rugby game the goal-posts are 18½ feet apart, and joined by a cross-bar at a height of 10 feet from the ground; and to score a goal the ball must be kicked over this bar by one of the opposite side. In the Association game the upright poles are 8 yards apart, and joined at 8 feet from the ground by a tape, under which the ball must pass to secure a goal. The Rugby game is much rougher and less scientific than the Association game, which discourages rough play and relies mainly on the skilful manœuvring of the ball with the feet, it being forbidden to touch the ball with the hands, while by the Rugby rules the player may catch the ball in his hands, run with it, and kick it dropping. When a goal is made, or at some other arranged interval, the parties change ground for the next struggle, so that any inequalities of situation may be balanced.

Force (fōrs), *n.* [*Fr.* *L.L.* *fortia*, *fortia*, from *L. fortis*, strong.] 1. In *physics*, that which is the source of all the active phenomena occurring in the material world, and of which motion, gravitation, heat, light, electricity and magnetism, cohesion, chemical affinity, are believed to be exhibitions; that which produces or tends to produce change; energy; as, the conservation of *force*.—2. Any one of the various modes or conditions under which *force* exhibits itself, as motion, heat, light, &c.; as, the correlation of *forces*.

The transformation and equivalence of *forces* is seen by men of science to hold not only throughout all inorganic actions but throughout all organic actions; even mental changes are recognized as the correlatives of cerebral changes which also conform to this principle; and there must be admitted the corollary, that all actions going on in a society are measured by certain antecedent energies which disappear in effecting them, while they themselves become actual or potential energies through which subsequent actions arise. *Herbert Spencer.*

3. Strength; active power; vigour; might; energy that may be exerted; as, by the *force* of the muscles we raise a weight, or resist an assault; the *force* of the mind, will, or understanding.—4. Momentum; the quantity of energy or power exerted by a moving body; as, the *force* of a cannon-ball; the *force* of the wind or waves.—5. Violence; power exerted against will or consent; compulsory power; coercion.

By *force* hath overcome but half his foe. *Milton.*

6. Moral power to convince the mind; influence; moral compulsion; as, there is great *force* in an argument.

7. Validity; power to bind or hold; as, if the conditions of a covenant are not fulfilled, the contract is of no *force*; a testament is of *force* after the testator is dead.—8. Strength or power for war; armament; troops; an army or navy; as, a military or naval *force*; sometimes in the plural; as, military *forces*. Hence—9. A body of men prepared for action in other ways; as, a police *force*.—10. In *law*, any unlawful violence to person or property. This is *simple*, when no other crime attends it, as the entering into another's possession without committing any other unlawful act. It is *compound* when some other violence or unlawful act is committed. *Force* is implied in every case of trespass, disseisin, or rescue.—*Of force*, of necessity; necessarily; unavoidably. [*Rare.*]

Good reasons must, of *force*, give place to better. *Shak.*

—No *force*, no matter.—I do no *force*, I care not. *Chaucer.*—*Kinetic force* or *energy*, the *force* which a body actually moving can exert, at any instant of its motion, on another body resisting it, as the *force* with which an arm actually in motion would strike any opposing object.—*Potential force* or *energy*, the energy stored up, as it were, in a body, and which it is capable of exerting, as distinguished from *kinetic energy*, or that which it exerts at any moment. Hence, the *potential energy* of an arm is the energy residing in it when at rest, or the residue between the *force* actually being exerted by the arm when moving and the highest degree of *force* it is capable of exerting. It is thus obvious that, the higher the *kinetic force*, the less is the *potential*, and *vice versa*—the one *force* being the complement of the other.—*Correlation of forces*, the doctrine that *force* or *energy* can exhibit itself in various definite modes or conditions, each of which is called 'a *force*,' these '*forces*' being mutually convertible into each other under certain conditions or circumstances. Thus motion, on being suddenly retarded or strongly resisted, becomes sensible heat, or, in certain circumstances, heat and light. This is observed when a bullet strikes against a target, when a piece of iron is hammered till it is red hot, or when heat and flame are generated by rubbing two pieces of wood together. Heat, in like manner, becomes motion or motive power when it expands water into steam which lifts the piston of a steam-engine.—*Conservation of force* or *energy*, the doctrine that the total amount of *force* or *energy* in the universe is always the same, though it may change its condition or mode of exhibition. See *extract*.

The 'great philosophical doctrine of the present era of science, as the subject about to engage our attention has been justly termed, bears the title of the 'Conservation of Force,' or, as some ambiguity is likely to attend the definition of the term 'Force,' the 'Conservation of Energy.' The basis of the doctrine is the broad and comprehensive natural law which teaches us that the quantity of *force* comprised by the universe, like the quantity of matter contained in it, is a fixed and invariable amount, which can be neither added to nor taken from, but which is forever undergoing change and transformation from one form to another. That we cannot create *force* ought to be as obvious a fact as that we cannot create matter; and what we cannot create we cannot destroy. And *force* and *matter* are taught to be indestructible; therefore motion must be indestructible also. But when a falling body strikes the earth, or a gunshot strikes its target, or a hammer delivers a blow upon an anvil, or a brake is pressed against a rotating wheel, motion is arrested, and it would seem natural to infer that it is destroyed. But if we say it is indestructible, what becomes of it? The philosophical answer to the question is this, that the motion of the mass becomes transferred to the particles or molecules composing it, and transformed to molecular motion, and this molecular motion manifests itself to us as heat. The particles or atoms of matter are held together by cohesion, or, in other words, by the action of molecular attraction. When heat is applied to these particles, motion is set up among them, they are set in vibration, and thus requiring and making wider room, they urge each other apart, and the well-known expansion by heat is the result. If the heat be further continued a more violent molecular motion ensues, every increase of heat tending to urge the atoms further apart, till at length they overcome their cohesive attraction and move about each other, and a liquid or molten condition results. If the heat be still further increased, the atoms break away from their cohesive fetters altogether, and leap off the mass in the form of vapour, and the matter thus

assumes the gaseous or vaporous form. Thus we see that the phenomena of heat are phenomena of motion, and of motion only.

—*Samuel Johnson and Carpenter.*

—*Moral force*, the power of acting on the reason in judging and determining.—*Physical force*, material influence; coercion, as by mere bodily strength.—*Mechanical force*, the power which produces or tends to produce motion, or an alteration in the direction of motion. Mechanical forces are of two sorts; one of a body at rest, being the same as pressure or tension; the other of a body in motion, being the same as impetus or momentum. The degree of resistance to any motion may be measured by the active *force* required to overcome that resistance, and hence writers on mechanics make use of the terms *resisting forces* and *retarding forces*. When two *forces* act on a body in the same *line of direction*, the resulting *force*, or *resultant* as it is called, will be the sum of both *forces*. If they act in opposite directions, the body will remain at rest if the *forces* be equal; or, if the *forces* be unequal, it will move with a *force* equivalent to their difference in the direction of the greater. If the *lines of direction* make an angle with each other, the resultant will be a mean *force* in an intermediate direction.—*Composition of forces*, the combining of two or more *forces* into one which shall have the same effect when acting in some given direction; *resolution of forces*, the decomposing of a single *force* into two or more *forces*, which, acting in different directions, shall be equivalent to the single *force*. The fundamental proposition of the composition of *forces* is as follows.—Any two *forces* acting at the same point, and represented in magnitude and direction by two straight lines, are equivalent to a third *force* which is represented in magnitude and direction by the diagonal of the parallelogram constructed with the two lines as its sides. Thus, let a body at A be acted upon by two *forces* at the same instant, one in the direction AB and the other in the direction AC, and the resultant *force* will be that of the diagonal AD of the parallelogram AB DC, and to the end of the given time the body will be found at D. The diagonal AD represents the resultant of the *forces* in the directions AB and AC, and is equivalent to them both. By means of this proposition the resultant of any number of *forces* whatever may be found, and also, any given *force* may be resolved into two others, such that the straight lines by which they are represented form the two sides of a parallelogram, of which the line representing the given *force* is the diagonal. The proposition is frequently termed the *parallelogram of forces*, and is of great importance in mechanical science. *Forces* have different denominations according to their nature and the manner in which they act; thus, we have *accelerating forces*, *central forces*, *constant forces*, *parallel forces*, *uniform and variable forces*, &c. See these terms in their proper places.—*Moving force* or *motive force*, the same as *Momentum*.—*Permanent force*, that which acts constantly; thus, the action of a weight suspended from a cord, or resting on a surface, is a permanent *force*.—*Impulsive force*, that which is applied suddenly to a body and immediately ceases to act upon it, as the blow of a hammer or percussion. *Animal force*, that which results from the muscular power of men, horses, and other animals.—*Line of direction of a force*, the straight line in which any *force* tends to make a body move. Similar *forces* acting on a body cause it to move in a straight line, but if the *forces* be dissimilar, the body will move in a curve line depending on the nature of the *forces*. Thus, a cannon-ball is acted on by the impulse of the charge, and by the *force* of gravity, and in consequence of these two dissimilar *forces* describes the curve of a parabola.—*Polygon of forces*. See *POLYGON*.—*Unit of force*, the single *force* in terms of which the amount of any other *force* is ascertained, and which is generally some known weight, as a pound.—*Equilibrium of forces*, the condition produced when any number of *forces*, which being applied to

a body, destroy one another's tendency to communicate motion to it, and thus hold it at rest.—*Forces, impressed and effective.* See under VIRTUAL.—*External forces*, those forces which act upon masses of matter at sensible distances, as gravitation.—*Internal forces*, those forces which act only on the constituent particles of matter, and at insensible distances, as cohesion.—*Polar forces*, those forces which are conceived to act with equal intensity, in opposite directions, at the extremities of the axes of molecules, or of masses of matter, as magnetism.
